NEW QUESTION: 1
When performing an indoor predictive site survey to make the WLAN planning and design cycle more efficient, what is a best practice for configuration of the simulated APs in the predictive modeling software?
A. Always use the default 2.2 dBi omnidirectional antenna patterns for simulated APs.
B. All simulated APs should be set to 20 MHz channels only.
C. If dynamic RRM will be used, AP transmit power should be set to an estimated average level of the expected client devices, such as 25 mW.
D. Defining custom AP and antenna patterns will yield more accurate prediction data than the preconfiguredvendor AP/antenna combinations.

Answer: C

NEW QUESTION: 3
A company has a hybrid architecture solution in which some
legacy systems remain on-premises, while a specific cluster of
servers is moved to AWS. The company cannot reconfigure the
legacy systems, so the cluster nodes must have a fixed hostname
and local IP address for each server that is part of the
cluster. The DevOps Engineer must automate the configuration
for a six-node cluster with high availability across three
Availability Zones (AZs), placing two elastic network
interfaces in a specific subnet for each AZ. Each node's
hostname and local IP address should remain the same between
reboots or instance failures. Which solution involves the LEAST
amount of effort to automate this task?
A. Create a reusable AWS CloudFormation template to manage an
Amazon EC2 Auto Scaling group with a minimum size of 1 and a
maximum size of 1. Give the hostname, elastic network
interface, and AZ as stack parameters. Use those parameters to
set up an EC2 instance with EC2 Auto Scaling and a user data
script to attach to the specific elastic network interface. Use
CloudFormation nested stacks to nest the template six times for
a total of six nodes needed for the cluster, and deploy using
the master template.
B. Create an Amazon DynamoDB table with the list of hostnames
subnets, and elastic network interfaces to be used. Create a
single AWS CloudFormation template to manage an Auto Scaling
group with a minimum size of 6 and a maximum size of 6. Create
a programmatic solution that is installed in each instance that
will lock/release the assignment of each hostname and local IP
address, depending on the subnet in which a new instance will
be launched.
C. Create an AWS Elastic Beanstalk application and a specific
environment for each server of the cluster.
For each environment, give the hostname, elastic network
interface, and AZ as input parameters.

Use the local health agent to name the instance and attach a specific elastic network interface based on the current environment.
D. Create a reusable AWS CLI script to launch each instance individually, which will name the instance, place it in a specific AZ, and attach a specific elastic network interface. Monitor the instances and in the event of failure, replace the missing instance manually by running the script again.
