A. Azure Stream Analytics
B. Azure Notification Hubs
C. Azure Event Grid
D. Apache Kafka streams
Answer: C
Explanation:
Explanation
Event Hubs Capture is the easiest way to automatically deliver
streamed data in Event Hubs to an Azure Blob storage or Azure
Data Lake store. You can subsequently process and deliver the
data to any other storage destinations of your choice, such as
SQL Data Warehouse or Cosmos DB.
You to capture data from your event hub into a SQL data
warehouse by using an Azure function triggered by an event
grid.
Example:

First, you create an event hub with the Capture feature enabled
and set an Azure blob storage as the destination. Data
generated by WindTurbineGenerator is streamed into the event
hub and is automatically captured into Azure Storage as Avro
files.
Next, you create an Azure Event Grid subscription with the
Event Hubs namespace as its source and the Azure Function
endpoint as its destination.
Whenever a new Avro file is delivered to the Azure Storage blob
by the Event Hubs Capture feature, Event Grid notifies the
Azure Function with the blob URI. The Function then migrates
data from the blob to a SQL data warehouse.
